

Bulletin of the Illinois State Laboratory of Natural History Volume 6

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1901 Excerpt: ...and to a varying extent in other years, this rise attends among other factors the restriction of contributions from impounding backwaters and the differentiation of what might be called channel plankton proper. The July production in 1894 averages 5.12 cm.³ per m.³--the largest. with the exception of that for 1895, of any year, and a fact to be correlated with the unusually stable conditions then prevalent. In August of this year the single collection forms the apex of the seasons production, reaching 9.67 cm.³ per m.³--an amount not surpassed for this month in any subsequent year. It may also be correlated with the continuance of stable conditions. The nearest approach to this amount is found in 1897 (9.45 cm.³, Table III.), likewise in stable conditions. It is not impossible that there is more than one culmination in the months of June and July, collections being at too great intervals to suggest the direction of the movement in production. The flood of September attends a decline of the plankton to a minimum of .34 on the 17th in the fluctuations in level on the crest of the flood (Pl. VIII.). Similar direction of movement in production may be traced in 1895, 1896, and 1898. This decline in production attends the beginning of the autumnal decline in temperature, 10-15 of which occur within this month. The hydrographic conditions during the remainder of the year are exceedingly stable, there being a gradual rise of only .5 ft. from the middle of October until the middle of December. Beyond the insignificant rise in the October catch no movement in production is evident. A comparison of these scanty data with the curves of production in these months in 1895 and 1897, both with

low-water autumns, makes it evident that collections in 1894 were too infrequent to...
