

A Textbook on Steam Engineering (Classic Reprint)

In the following list, called the electric fierles, the tubsances are arranged in such order that each receives pcjV rr charge when rubbed or placed in contact with any i the bodies following it, and a negative charge when rubbed fcrith any of those which precede it: 1. Fur. 6, Cotton, 11, Sealing-wax. 2. Flannel. 7. Silk. 12. Resins. 3. I vory, 8. The body. IH. Sulphur. 4. Crystals. 9. Wood. 14. Gutta-percha. 6. Glass. 10. Metals. 15. Giincottnn, For example, gluss when rubbed with rreceives a ntgalive charge, but when rubbed with silk (t receives a positive charge.

CONDUCTORS AND

Jfon-CONTJUCTO nS. 8. Only that part-of a dry glass rod which has been rubbed will be electrified; the other parts will produce neither repulsion nor attraction when brought near a suspended pith-ball. The same is true of a piece of sealingwax or resin. These bodies do not readily f(iW felectricity; that is, they oppose or resist the passage of electricity through them. Therefore, it can only reside as a charge upon that part of their surface where it is developed. Experiments show that when a metal receives a charge at any point, the electricity immediately passes or flows through its substance to all parts. Metals, therefore, are said to be vconductors of electricity. BtK lies have accordingly been divided into two classes, i. e., Don-conductors, or I nsulators, or those bodies which offer a very high resistance to the passage of electricity, and conductors, or those bodies which offer a comparatively low resistance to its passage. This distinction is not absolute, for all bodies conduct electricity to some extent, while there is no known substance which does not offer some resistanci; to the flow of cjty.(Typographical errors above are due to OCR software and dont occur in the book.)About the Publisher Forgotten Books is a publisher of historical writings, such as: Philosophy, Classics, Science,
