

Course in Computational Electrostatic Field Theory was written to show how real engineering electrostatic problems are solved using FlexPDE. It is necessary for most students to not only study the examples given therein but to solve electrostatic problems independently. The text poses several problems that should be solved by the serious student. In those cases the students should not read these solutions unless they are absolutely unable to solve the problems. Here are solutions to these problems best studied only after one has devoted considerable effort to solve them and failed!
